

Data Scientist

Job Responsibilities:

- Process, cleanse and verify the integrity of data used for analysis.
- Implement Machine Learning and Deep Learning models.
- Doing experiments with the implemented models, including, train, test, fine tuning, hyper-parameter tuning
- Conduct ad-hoc analyses and present results in a clear manner.
- Enhance data collection procedures to include information that is relevant for building models.
- Working in a team with the ML leader

Required profile:

- A bachelor or master degree in engineering, computer science, applied mathematics or related field.
- Experience in implementing and running projects in Machine Learning, Deep Learning, Data science, etc.
- Knowledge in machine learning and deep learning algorithms such as, clustering, classification, CNNs, FC networks, regression, time series.
- Knowledge and experience in working with database such as SQL or Oracle.
- Familiarity and experience with (one or two) programming languages and ML/DL tools: Python, Java, Pytorch or Tensorflow, scikit-learn, Numpy, Pandas.
- familiarity with (Preferable but not obligatory): hydra, git, aws.
- Experience in execution and training ML models in Cloud environment.
- Experience with software development in Linux environment.
- oral and written communication skills in English.
